

RAGuard Enterprise Architecture Overview.

The system uses FastAPI, Celery, PostgreSQL, and Qdrant.

This is a padding sentence to ensure the word count exceeds fifty.

We need to bypass the OCR fallback logic in the pdf extractor.

The pdf extractor flags any document with fewer than fifty words as needing OCR.

However, our worker container does not have Tesseract installed by default.

Therefore, we must provide a text rich document to avoid triggering the fallback.

Here are more words just to be absolutely certain we cross the threshold.

This should be more than enough words to successfully extract without OCR.
